

Python List Functions – Examples

Quick reference with simple code examples and outputs

1. append()

Adds one element at the end of the list.

Code:

```
numbers = [10, 20, 30]
numbers.append(40)
print(numbers)
```

Output:

```
[10, 20, 30, 40]
```

2. extend()

Adds multiple elements from another list or iterable.

Code:

```
numbers = [10, 20, 30]
numbers.extend([40, 50, 60])
print(numbers)
```

Output:

```
[10, 20, 30, 40, 50, 60]
```

3. insert()

Adds an element at a specific index.

Code:

```
numbers = [10, 20, 30]
numbers.insert(1, 15)
print(numbers)
```

Output:

```
[10, 15, 20, 30]
```

4. remove()

Removes the first occurrence of a value.

Code:

```
numbers = [10, 20, 30, 20]
numbers.remove(20)
print(numbers)
```

Output:

```
[10, 30, 20]
```

5. pop()

Removes and returns an element. Without an index, it removes the last element.

Code:

```
numbers = [10, 20, 30, 40]
x = numbers.pop()
print(numbers)
print(x)
```

Output:

```
[10, 20, 30]
40
```

6. clear()

Removes all elements from the list.

Code:

```
numbers = [10, 20, 30]
numbers.clear()
print(numbers)
```

Output:

```
[]
```

7. index()

Returns the index of the first occurrence of a value.

Code:

```
numbers = [10, 20, 30, 20]
x = numbers.index(20)
print(x)
```

Output:

```
1
```

8. count()

Counts how many times a value occurs.

Code:

```
numbers = [10, 20, 20, 30, 20]
x = numbers.count(20)
print(x)
```

Output:

```
3
```

9. sort()

Sorts the list in ascending order.

Code:

```
numbers = [50, 10, 40, 20, 30]
numbers.sort()
print(numbers)
```

Output:

```
[10, 20, 30, 40, 50]
```

10. reverse()

Reverses the order of the list.

Code:

```
numbers = [10, 20, 30, 40]
numbers.reverse()
print(numbers)
```

Output:

```
[40, 30, 20, 10]
```

11. copy()

Creates a shallow copy of the list.

Code:

```
numbers = [10, 20, 30]
new_numbers = numbers.copy()
new_numbers.append(40)

print(numbers)
print(new_numbers)
```

Output:

```
[10, 20, 30]
[10, 20, 30, 40]
```

Quick Revision Table

Function	Purpose	Example
append()	Add one element	list.append(10)
extend()	Add multiple elements	list.extend([10, 20])
insert()	Add at a specific index	list.insert(1, 10)
remove()	Remove a value	list.remove(10)
pop()	Remove by index / last	list.pop()
clear()	Remove everything	list.clear()
index()	Find index	list.index(10)
count()	Count occurrences	list.count(10)
sort()	Sort the list	list.sort()
reverse()	Reverse the list	list.reverse()
copy()	Copy the list	list.copy()

Easy way to remember:

ADD → append(), extend(), insert()

REMOVE → remove(), pop(), clear()

SEARCH → index(), count()

ORDER → sort(), reverse()

COPY → copy()
